

## Constraints:

Constraints in a database are rules enforced on data columns to ensure the integrity, accuracy and reliability of the data stored in the database.

### Types of constraints:

#### ① Primary key:

- ensure each row in a table has a unique identifier.
- No NULL value allowed

#### Example:

```
CREATE TABLE students (  
  StudentID INT PRIMARY KEY,  
  Name VARCHAR(100)  
);
```

#### ② Foreign key:

- ensures the referential integrity of data in one table to match values in another table.

#### Example:

```
CREATE TABLE Orders (  
  OrderID INT PRIMARY KEY,  
  CustomerID INT  
  FOREIGN KEY (CustomerID) REFERENCES customers (CustomerID)  
);
```

### ③ Unique:

Ensures all values in a column are unique.

- Allows one NULL value.

Ex:

```
CREATE TABLE Employees (
```

```
EmployeeID INT PRIMARY KEY,
```

```
Email VARCHAR(100) UNIQUE
```

```
);
```

### ④ Not NULL Constraint:

- Ensures a column can't have a NULL value.

Example:

```
CREATE TABLE Products (
```

```
ProductID INT PRIMARY KEY,
```

```
ProductName VARCHAR(100) NOT NULL
```

```
);
```

## ⑤ check:

- Ensures the values in a column meet a specific condition.

Example:

```
CREATE TABLE Accounts (  
  AccountID INT PRIMARY KEY,  
  Balance DECIMAL(10,2),  
  CHECK (Balance > 0)  
);
```

## ⑥ Default:

- provides a default value for a column when no value is specified.

Example:

```
CREATE TABLE Orders (  
  OrderID INT PRIMARY KEY,  
  OrderDate DATE DEFAULT GETDATE()  
);
```

#

: N39H5

②

NOT NULL

Student

Unique

check (10+)

Primary Key

Roll	Name	Email	Address	Age

Library

Foreign Key

Primary Key

Book Name	Roll

## # SELECT Query:

Comparison Operators ( $=, <, >, <=, >=$ )

Syntax:

```
SELECT column1, column2, ...
FROM table-name;
```

### \* selecting all columns:

```
SELECT * FROM table-name;
```

### \* selecting specific columns:

```
SELECT Roll, Name FROM students;
```

### \* Using WHERE clause:

```
SELECT * FROM students WHERE Age > 18;
```

### \* Arithmetic Operators (+, -, \*, ÷, %):

```
SELECT CSE+ME, CSE-ME, CSE*ME, (CSE+ME)/2
FROM Marks
WHERE Roll = 104;
```

Marks		
Roll	CSE	ME
101	10	20
102	20	40
103	30	50
104	7	10

- Comparison Operator ( $=, <, >, \leq, \geq, \neq$ ):

SELECT \* FROM student  
WHERE Age  $> 15$ ;

Roll	Age
101	10
102	20
103	30
104	40

- Logical AND, OR operators:

SELECT Name  
FROM Employee  
WHERE salary  $> 9000$  AND Age  $> 24$

ID	Name	Salary	Age	Designation
1	A	10000	22	Snn. SWE
2	B	15000	23	Jm. SWE
3	C	20000	24	Team lead
4	D	12000	25	Pr. Manage
5	E	9000	24	Snn. SWE

- DISTINCT:

SELECT DISTINCT Designation  
FROM Employee;

→ Selects all the distinct designation.

• Note:

SELECT  
FROM  
WHERE  
ORDER BY  
LIMIT  
OFFSET

• ORDER BY:

SELECT Name  
FROM Employee  
ORDER BY salary

ASC;  
DESC;

Ascending order

Descending order

• Limit Offset:

SELECT  
FROM  
WHERE  
ORDER BY  
LIMIT 10  
OFFSET 59

LIMIT 59, 10

## IN:

```
SELECT *  
FROM students  
WHERE Roll IN (1,3,5)
```

— select students with  
Roll numbers 1,3,5

## NOT IN:

```
SELECT *  
FROM students  
WHERE Roll NOT IN (1,2,3)
```

— select students whose  
roll numbers aren't

## LIKE:

- To search for a specified pattern in a column.

- '%' → represents zero or more characters

- '\_' → represents a single character.

```
SELECT * FROM students  
WHERE Name LIKE 'A%';
```

→ select students whose names  
start with 'A'

```
SELECT * FROM students  
WHERE Email LIKE '%.gmail%';
```

→ select students whose email  
contains gmail

- AS:

used to rename a column on table with an alias.

```
SELECT Name AS StudentName  
FROM Students;
```

→ selects the name column but rename it to StudentName in the result set.
